

## Catalog

For the project I did, I went and chose the development track. I have included all the code that I have written for this project in this zip and the documentation as well. I also have included a script for testing out the features in the application.

The main files that I worked on that should be noted are all pretty much within the /src folder. That includes the files App.css, App.js, Innerposts.jsx, Notes.jsx, Posts.jsx, and Stats.jsx.

If you have React installed on your computer locally, then you can just grab the project off the Github link I listed and build then start the application up how you usually start your other React projects. If you don't have React installed, then you can just go to the Link to the Application that I listed below to see how the project works.

The Github link is here: <https://github.com/wilkinv/FuzeEduboard>

The Link to Application is Here: <http://edufuzeboard.s3-website.us-east-2.amazonaws.com/>
